

We last discussed that by taking a few simple steps you can make your PC much safer...

Here is the **second** super easy way to do it:

2

Use two-factor authentication, whenever possible...

Two-factor authentication has made the internet much more secure. Generally, two-factor authentication requires that you:

Enter a code generated by an app on your phone or sent to you via text message...

...in addition to your account password.

It ensures that **EVEN IF A HACKER HAS YOUR PASSWORD**, they can't get into your account!

You should use two-factor authentication on everything you can, from your bank account to your social media accounts to your email...

"Sure, it can sometimes be a **pain in the backside**, but it is so worth it. I use this on all my online (in particular my Google) accounts."

There is a handy guide for services that offer two factor authentication at: <https://twofactorauth.org/>
